🔑 Actual Login Credentials

Current Users in Database

Based on your database, here are the **ACTUAL** users you should use to login:

1. Admin Account

```
Username: admin
Password: admin123
Role: Admin
```

2. Other Users (All use password: `password123`)

Username	Password	Role
clarence.simwanza	password123	(Unknown - check in app)
kanyembo.ndhlovu	password123	(Unknown - check in app)
joe.munthali	password123	(Unknown - check in app)
justine.kaluya	password123	(Unknown - check in app)
anne.banda	password123	(Unknown - check in app)
sarah.banda	password123	Finance Manager

⚠️ Important Notes

1. **These are the REAL users in your database**
   - The users shown in the server startup message (john.banda, mary.mwanza, etc.) do NOT exist in your current database

2. **All passwords are hashed and working** ☑
   - The hashPasswords script has been run
   - Login should work now

3. **Try logging in with these credentials:**

   ```
   admin / admin123
   ```

   OR

   ```
   sarah.banda / password123
   ```

🔍 To Check User Roles

After logging in as `admin`, go to the Admin Console to see all users and their roles.

📝 If You Need Different Users

If you want to add the default demo users (john.banda, mary.mwanza, etc.), you would need to:

1. Login as admin
2. Go to Admin Console → User Management
3. Add new users manually

OR run the database initialization script to reset the database with default users.

Try logging in now with:

- Username: `admin`
- Password: `admin123`

This should work from any computer on your network at:

- `http://ZMKTCMW002:3001`
- `http://192.168.5.249:3001`
